Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

JC6552
DNA topoisomerase (EC 5.99.1.2) - slime mold (Physarum polycephalum)
NyAlternate names: emega-protein; micking-closing enzyme; type I DNA topoisomerase
C;Species: Physarum polycephalum
C;Species: DS-Dec-1998 #sequence_revision 05-Dec-1998 #text_change 09-Jul-2004
C;Accession: JC6552

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

Claim 10; Page 14; 72pp; English.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention of escribes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides

```
of the invention are used as molecular weight markers for glatiramer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune baemolytic anaemia, autoimmune cophoritis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Gilllain-Barrés syndrome, Hashimoto's disease, idiopathic mysodema, mysethenia gravis, syndrome, Hashimoto's disease, idiopathic mysodema, mysethenia gravis, psoriasis, pemphigus vulgatis, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, colypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer accetate molecules, which
                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  glatiramer acetate, autoimmune disease, antiarthritic, neuroprotective, osteopathic, immunosuppressive, antithyroid, antiinflammatory; antidaabetic, thyromimetic, haemostatic, antipsoriatic, dermatological, antianaemic, immunosuppressive, demyelinating disease, osteoarthritis, inflammatory condition; multiple sclerosis; rheumatoid arthritis, crohn's disease, chronic immune thrombocytopaenia purpura; colitis, diabètes mellitus; Graves disease, Guillain-Barre's syndrome, psoriasis;

weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP) which has an identified molecular weight and an an among an identified molecular weight and an an actid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer of the invention are used as molecular weight markers for glatiramer of the invention are used as molecular weight markers for glatiramer contracting and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, autoimmune hamolytic anaemia, autoimmune carbitis, autoimmune thrombocytopaenia purpura, collitis, contact sensitivity disease, dispetes mellitus, Garves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, graft-versus-bost disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  glatifamer acctate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antithyroid; antiinflammatory; antidabetic; thyromimetic; haemostatic; antipsoriatic; dermatological; antianaemic; immunosuppressive; demyelinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; cronn's disease; chronic immune thrombocytopaenia purpura; colitis; diabetes mellitus; Graves disease; dulllain-Barre's syndrome; psoriasis; Hashimoto's disease; idiopathic myxoedema; myasthenia gravis;

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related terrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroidmine haemolytic anaemia, autoimmune cophoritis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxodedma, mysthania gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, and delayed-type hypersensitivity. The properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight and an offer composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer cof the invention are used as molecular weight markers for glatiramer cof the invention are used as molecular weight markers for glatiramer cactate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune tharoidmine haemolytic anaemia, autoimmune thyroidmitis, autoimmune thrombocytopaenia purpura, colitis, contact compositivity disease, disease, idiopathic mysoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, chronic immune haemolymic mysoedema, myasthenia gravit, or graft-versus-host disease, and delayed-type hypersensitivity. The correct co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1;

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides [1] for determining the molecular weight invention describes polypeptides [1] for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer actactate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroidmits, autoimmune veorestinitis, crohn's cliease, chronic immune thyroidmits, autoimmune veorestinitis, crohn's cliease, chronic immune thyroidmits, graves disease, Guillain-Barre's syndrome, Hashinoto's disease, idopathic mysoedema, myashinota graves, capaciasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graff disease, copypertides of the invention have defined molecular weights and physical properties which are analogous to glatiramer accetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                 Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

The present invention provides the protein and coding sequences of a number of apoptosis associated proteins from the yeast Saccharomyces cerevisiae and the fungus Candida albicans. These can be used to identify treatments for fungal and yeast infections, for proliferative diseases and for apoptosis related diseases such as autoimmune diseases, ischaemia and neurodegeneration. The present sequence is one of the C. albicans proteins of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determaining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glattramer cof the invention are used as molecular weight markers for glattramer cactate related terrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases continued activated or antibody-mediated diseases such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatory conditions, e.g. multiple sclerosis, rheumatory conditions, e.g. multiple sclerosis, contract coophoritis, autoimmune thyroidmune theomory topaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic mysocedema, myasthenia gravis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, colypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which correct conditions are subjected at markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ij
                                                                                                                                                                                                                                                                                                                                                                                                      Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

Constructing a strain of diploid fungal cells in which both alleles of a gene are modified comprises modifying the alleles of a gene in the fungal cells by recombination using a gene disruption cassette and a promoter replacement fragment

Claim 44; SEQ ID NO 7226; 163pp; English.

The invention relates to a novel method for constructing a strain of dipold fungal seels in which he allelse of a gene as modified. The method comprises medifying the allelse of a gene as modified. The method comprises medifying the allelse of a gene as modified. The method comprises medified in the method comprises assembling a conjecture of Exploid fungal cells according to the process of a gene as a prometra of the process of the gene a conjecture and the process of the gene and the process of a fightoid fungal at the collection; a nucleic acid molecules where substantially all the different genes that is essential to the cultarion of the survival or a fungal and the different genes that is essential to the cultarion of a fungal seem to a target mucleic acid molecules of a fungal, that contributes to the virulence of a diploid fungat to an artifungal agent; identifying an antifungal seem of a diploid fungal to a target mucleic despendent of a fungal agent; identifying an antifungal agent for treatment of a mammalian disease, corralating changes in the constraing a process of a diploid fungal to a target molecule comprising a process of process of process of a diploid fungal to a purified to the nucleic acid molecule comprising an uncleance endoding a gene product comprising a product conference of a diploid fungal to a long the product of comparising of at least of constants of an artification (Appsprised some process of a purified to a gene transf at least one amino acid sequence selected from ADP98826-ADP99135; a method assisted by a computer for identifying a putatively essential gene of a fungus; and a protein array comprising proteins, where at least one protein comprises an amino acid sequence or a portion of an amino acid sequence selected from ADP98516-ADP98825. The novel methods and compositions have fungicide activity. The compositions amy be used in gene therapy. The composition and methods are useful for drug screening purposes or for diagnosing, preventing or treating infections associated

ä the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense autisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) with Candida albicans. These may also be used for constructing strains useful for identification and validation of gene products as effective targets for therapeutic intervention, for identifying and validating gene products as effective targets for therapeutic intervention, and for collecting identified essential genes. This sequence represents the protein of a Candida albicans fungal specific gene of the invention.

NOTE: This sequence was downloaded from an electronic sequence listing provided on the WIPO website. New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. The invention relates to an isolated nucleic acid comprising any one of Antisense; prokaryotic essential gene; cell proliferation; drug design. ```
identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, s activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of trains; or (13) identifying the target of a compound that inhibits the strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational cup discovery programs, or for screening homologous nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this capter did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the target prokaryotic_sequences

concoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated encoding a polypeptide whose expression is inhibited by the antisense polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation or the activity of agene in an operon required for proliferation or that has an activity against a bhological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed, (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for ceilular proliferation to isolate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant copolymer 1; COP-1-77; myelin basic protein; MBP; immunological activity; autoimmune encephalomyelitis; multiple sclerosis.

for improve the expression of rCOP-1 polypeptides in B. coli, genes coding for rCOP-1-77 were subcloned from pREV 2.1 to pBG3-2deltaN (deposit: 20-NOV-1984 Us4691009), MRLL B-15910), a plasmid used to express Protein A. The resulting plasmids encode fusion proteins consisting of beta-glucuronidase, Protein A, and rCOP-1 sequences. A methionine residue occurs between the Protein A and rCOP-1 sequences, originating from the Co-1 long between the Protein A and rCOP-1 sequences, originating from the control and protein. TWOP-1-77 contains oligonucleotide duplexes incoding the following segments: YKK, EAE, KAK, AAK, and AAA. The N-terminal alanine residue is left behind following CMST cleavage of the fusion protein. The product prevents or arrests experimental autoimmune encephalomyelitis. They are used to prevent, arrest or control a demyelinating disorder, e.g. multiple sclerosis. They may also be used as additives to hair care products to confer beneficial effects on damaged hair or as supplements for diets deficient in certain amino acids. See also AAQ05665. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                      ï

The invention relates to an isolated nucleic acid comprising any one

```
coffee nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid

encoding a polypeptide whose expression is inhibited by the antisense

mucleic acid; (2) a host cell containing the vector; (3) an isolated

contisense nucleic acid; (4) an antibody capable of specifically binding

the polypeptide or its fragment whose expression is inhibited by the

contisense nucleic acid; (4) an antibody capable of specifically binding

the polypeptide; (5) producing the polypeptide; (6) inhibited by the

proliferation or the activity of a gene in an operon required for

proliferation or that has an activity against a biological pathway or

continued for proliferation, or that inhibits cellular proliferation; (8)

conquired for proliferation, or that inhibits cellular proliferation of an identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a

compound; activity; (11) a culture comprising strains in which the extent or compound activity; (11) a culture compound that inhibits proliferation of an organism acts; or 13) identifying the target of a compound that inhibits the

compound; or the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of correctly proliferation of an organism. The antisense nucleic acids required contiferation of an organism. The antisense moleic acids required contiferation of an organism or some captide are useful for dentifying proteins or screening for homologous nucleic acids required for dentifying proteins or screening for homologous mucleic acids required for dentifying proteins or screening to a compound acids required for dentifying proteins or screening to a compound acids required for dentifying proteins or screening to a compound acids required for dentifying proteins or screening to a compound acids required for dentifying proteins or screening to a compound acids required for dent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed patent bublished pot_sequences
  the 6213 antisense sequences given in the specification where expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Biofilm formation modulation; biofilm-associated disease; cystic fibrosis; AIDS; middle ear infection; acne; periodontal disease; catheter-associated infection; medical device-associated infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention comprises a method for identifying a compound capable of modulating biofilm formation by bacteria. The method of the invention is useful for identifying a compound capable of modulating biofilm formation by bacteria or modulating bacterial antibiotic resistance. The method of the invention is also useful for diagnosing and treating a subject (especially an immunocompromised human) that is afflicted with a biofilm-sasociated disease or disorder, such as: oystic fibrosis; AIDS; middle ear infections; acne; periodontal disease; catheter-associated infections; and medical device-associated infections. The present amino acid sequence represents a protein that is used in the invention
                                   Identifying compound capable of modulating biofilm formation by bacteria/bacterial antibiotic resistance, useful for treatment of biofilm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bacterial infection; Pseudomonas aeruginosa infection; antibacterial

including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences AB067826-sequence represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at

Sequence 5, Application US/0981698A

Sequence 5, Application US/0981698A

Sequence 5, Application US/0981698A

GENERAL INFORMATION:
APPLICANT: Gad, Alexander
APPLICANT: Lis, Doris
APPLICANT: Lis, Doris
TITLE OF INVENTION: COPOLYMER 1 RELATED POLYBEPTIDES FOR USE AS MOLECULAR WEIGHT MARK
TITLE OF INVENTION: AND FOR THERAPEUTIC USE
TITLE OF INVENTION: AND FOR THERAPEUTIC USE
TITLE OF INVENTION NUMBER: US/09/816,989A

CURRENT APPLICATION NUMBER: US/0101,693

PRIOR FILING DATE: 1998-09-25

PRIOR FILING DATE: 1999-09-24

NUMBER OF SEQ ID NOS: 7

SOFTWARE: PATCHIL VERSION 3.1
                                                                              APPLICANT: Lis, DOTIS

Patent No. 5721212
GENERAL INFORMATION:
APPLICANT: Wakefield, Thomas W.
APPLICANT: Andrews, Philip C.
APPLICANT: Stanley, James C.
TITLE OF INVENTION: NOVEL PEPTIDES FOR HEPARIN AND TITLE OF INVENTION: LOW MOLECULAR WEIGHT HEPARIN TITLE OF INVENTION: ANTICOAGULATION REVERSAL
                                     GENERAL INFORMATION:

Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases such diseases include arthritic conditions, a service arthritis, autoimmune hamonitis, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune hamoniditis, autoimmune thyroiditis, autoimmune thyroididis, e.g. multiple sclerosis, forbn's clisease, chronic immune thyroididis, graves disease, Guillain-Barre's clisease, chronic immune thrombocytopeania purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxocedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated-contains, phost disease, and delayed-type hypersensitivity. The properties which are analogous to glatizamer acetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                e,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 АККҮАККЕКАУАККАЕКААККАЕАКАҮКААЕАКККАКАКАКАКАКАККЕКТАЛАБАК 60
                                                                                                                                                                                                AAV82571 to AAV82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present
                                             Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 AKKYAKK----AKAEKA----KKAYKAAEAKKAAKYE-----AKAEKA

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glattramer act actate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases catter related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases of diseases such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatory conditions, e.g. multiple sclerosis, rheumatory conditions, e.g. multiple sclerosis, cronn's disease, chronic immune thyroidments haemolytic ansemia, autoimmune coophoritis, autoimmune thyroidments, disease, disease, disease, disease, dispetes mellitus, Graves disease, disease, shinch can be treated include host-versus-graft disease, sporiasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, colypeptides of the invention have defined molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 AKKYAKKEKAYAKKAEKAAKKAEAKAYKAAEAKKKAKAKAEAKKYAKAAKAEKKEYAAAEAK 60
                                                                                                                                                                                              Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:4.
